

King Saud University
 College of Computer and Information Sciences
 Department of Computer Science
 CSC113 – Computer Programming II – Linked List Lab – Fall 2019

Element class:

- **Attributes:**
 - *id*: the id of the element
 - *info*: the info of the element
- **Methods:**
 - *Element(int id, String info)*: constructor
 - *equals(Element e)*: returns true if the two elements have the same id
 - *getID()*: returns the id of the element
 - *toString()*: returns a string representation of the element

Node class:

- **Methods:**
 - *Node(Element data)*: constructor

Interface List:

- See attached file

LinkedList class:

- **Attributes:**
 - **head:** node acting as the head of the linked list
- **Methods:**
 - **LinkedList():** default constructor
 - **count(Element e):** returns the number of occurrences of the element in the list
 - **reverse():** reverses the order of the elements in the list. Example:(1st, 2nd, 3rd, ..., ith □ ith, i-1th, i-2th, ..., 1st)
 - **toString():** returns a string representation of the list and its elements

Exercise 1: Translate into Java code the previous classes.

Exercise 2: Write a main method that tests the functionalities of the previous classes.

Example:

- Create a LinkedList
- Add some elements to it & print its contents
- Remove some elements from it & print its contents
- Replace some elements in it & print its contents
- Print the size of the list
- Retrieve an element at some position and print it
- Print the count of some element
- Reverse the list & print its contents
- Clear the list & print its contents
